The Ultimate Pet Health Guide

Being a veterinarian can be a rewarding, challenging and demanding career requiring a passion for animals, great interpersonal skills and a strong work ethic. It also has a dark and very dangerous side. The suicide rate for veterinarians is almost four times higher than the general population across the UK, Australia, US, New Zealand and Canada. The effects of working long hours, performing euthanasia on animals, emotional pressure, financial issues, unrealistic expectations, and dealing with distressed clients places considerable stress on both the vet themselves and their families at home. Failure to cope with such stress upsets mental wellbeing and can lead to serious emotional, physical, and behavioural issues. For some it leads to death. If we are to reduce this suffering we need to find out what hinders a vet's wellbeing and use targeted solutions that work. In this unique book, psychologist Dr Nadine Hamilton presents an examination of the problem, the ways vet mental health is influenced by their daily work and the science we can use to tackle it head on. Drawing from the fields of positive psychology, acceptance and commitment therapy, career construction theory, and resiliency studies, she outlines a promising new

weapon in the profession's fight against suicide. Included in this book is a concise self-help version of her ground-breaking Coping and Wellbeing Program for Veterinary Professionals — an evidence-based psycho-educational intervention to educate vets on how to develop protective attitudes, enhance wellbeing, and increase their coping skills. This is a book for every veterinarian, veterinary student and veterinary nurse.

Veterinary Nursing of Exotic Pets

Traditional preclinical mouse models of cancer have been very useful for studying the biology of cancer,

Read Book Clinical Veterinary Advisor Dogs And Cats 2e

however they often lack key characteristics of human cancers. As a result, many novel drug candidates fail in human clinical trials despite evidence of drug efficacy in those preclinical models. Thus, researchers are seeking new approaches to augment preclinical knowledge before undertaking clinical trials for human patients. Recently, there has been renewed interest in comparative oncology - the study of naturally developing cancers in animals as models for human disease - as one way to improve cancer drug development and reduce attrition of investigational agents. Tumors that spontaneously develop in pet dogs and other companion animals as a result of normal aging share many characteristics with human cancers, such as histological appearance, tumor genetics, biological behavior, molecular targets, and therapeutic response. In June 2015 the Institute of Medicine hosted a workshop to examine the rationale and potential for integrating clinical trials for pet patients with naturally occurring cancers into translational cancer research and development. Participants discussed the research needs, strategies, and resources to support greater integration of clinical trials for pets with cancer into translational research pathways, and challenges and potential solutions for facilitating that integration. This report summarizes the presentations and discussions from the workshop.

From budgies and cockatiels to chipmunks and chinchillas, our interest in exotic pets has rocketed in recent years. With the house rabbit being the UK's third most commonly kept pet after the cat and dog, and sales in small mammals, reptiles and birds continuing to grow, exotic pets have now become a specialist area of veterinary practice in their own right. Veterinary Nursing of Exotic Pets is the first book to address the need for a definitive reference book devoted entirely to the principles and applications of nursing exotic species. Developed from a City and Guild's course, it not only covers husbandry, nutrition and handling, but also explores anatomy and chemical restraint, and provides an overview of diseases and treatments.

As a holistic veterinarian and scientist, Dr. Gary Richter helps dog and cat owners to navigate the thicket of treatment options and separate the fact from the fiction. He wants us to use what actually works, not just what Western science or alternative medicine say "should" work. This multifaceted approach to health is known as integrative medicine. Dr. Richter examines traditional medicine from many cultures alongside modern medical techniques, describing the best of complementary care and the best of conventional veterinary medicine. Every treatment he recommends has the backing of scientific research or years of successful outcomes in his clinical practice. After explaining the treatment, he offers specific recommendations for an integrative approach to common diseases, including allergies, skin conditions, diabetes, heart disease, and cancer. A holistic approach to health includes nutrition, as it sets up the foundation for your pet's health. Dr. Richter cuts through the hype in the pet-food world and explains how to choose the best commercial foods and supplements, and even includes both raw and cooked dog- and cat-food recipes for general diet as well as to treat specific needs. He also explains how we can use the right foods and supplements to "hack" the body's processes, including the immune system.
