An entertaining, mischievous tale, ideal for children practising their reading at home or in school. Joe doesn't play with his toys much any more - he prefers the exciting games on his tablet. But he keeps waking up to an untidy bedroom with his toys scattered everywhere! Could it have something to do with Roaring Rita the dinosaur and Sir Clanky the knight? This action-packed story of friendship and compromise from much-loved author Tony Bradman (author of *Through My Window* and *Dilly the Dinosaur*) is perfect for fans of *Toy Story* and for children who are learning to read by themselves and for Key Stage 1. It features engaging illustrations by Yvonne Campedel and quirky characters young readers will

Sauropods, those huge plant-eating dinosaurs, possessed bodies that seem to defy every natural law. What were these creatures like as living animals and how could they reach such uniquely gigantic sizes? A dedicated group of researchers in Germany in disciplines ranging from engineering and materials science to animal nutrition and paleontology went in search of the answers to these questions. Biology of

the Sauropod Dinosaurs reports on the latest results from this seemingly disparate group of research fields and integrates them into a coherent theory regarding sauropod gigantism. Covering nutrition, physiology, growth, and skeletal structure and body plans, this volume presents the most up-to-date knowledge about the biology of these enormous dinosaurs.

### **When Sue Found Sue**

Explains the evolutionary relationship of dinosaurs, answers fifty specific questions about them, profiles forty-one specimens, and describes six expeditions of the American Museum of Natural History.

In 1878, the first complete dinosaur skeleton was discovered in a coal mine in Bernissart, Belgium. Iguanodon, first described by Gideon Mantell on the basis of fragments discovered in England in 1824, was initially reconstructed as an iguana-like reptile or a heavily built, horned quadruped. However, the Bernissart skeleton changed all that. The animal was displayed in an upright posture similar to a kangaroo, and later with its tail off the ground like the dinosaur we know of today. Focusing on the Bernissart discoveries, this book presents the latest research on Iguanodon and other denizens of the Cretaceous ecosystems of Europe, Asia, and Africa. Pascal Godefroit and contributors consider the Bernissart

locality itself and the new research programs that are underway there. The book also presents a systematic revision of Iguanodon; new material from Spain, Romania, China, and Kazakhstan; studies of other Early Cretaceous terrestrial ecosystems; and examinations of Cretaceous vertebrate faunas.

### **Against the Grain**

Discusses the characteristics and habits of giraffes.

### **IQ Brain Twister**

Sixty-five million years ago, a comet or asteroid larger than Mount Everest slammed into the Earth, inducing an explosion equivalent to the detonation of a hundred million hydrogen bombs. Vaporized detritus blasted through the atmosphere upon impact, falling back to Earth around the globe. Disastrous environmental consequences ensued: a giant tsunami, continent-scale wildfires, darkness, and cold, followed by sweltering greenhouse heat. When conditions returned to normal, half the plant and animal genera on Earth had perished. This horrific chain of events is now widely accepted as the solution to a great scientific mystery: what caused the extinction of the dinosaurs? Walter Alvarez, one of the Berkeley scientists who discovered evidence of the impact, tells the story behind the development of the initially controversial theory. It is a saga of high adventure in remote locations, of arduous data collection and intellectual struggle, of long periods of frustration ended by sudden breakthroughs, of

friendships made and lost, and of the exhilaration of discovery that forever altered our understanding of Earth's geological history.

rather than by taxonomic ranks and types. This volume will document the Real World uses of PhyloCode and will govern and apply to the names of clades, while species names will still be governed by traditional codes. Key Features Provides clear regulations for implementing new guidelines for naming lineages of organisms incorporates expressly evolutionary and phylogenetic principles Works with existing codes of nomenclature Eliminates the reliance on rank-based classification in favor of phylogenetic relationships Related Titles: Rieppel, O. Before the word dinosaur was even invented, an English girl discovered a remarkable skeleton on the rocky beach at Lyme Regis. Thus began a lifelong passion for the woman who became one of the first commercial fossil collectors. Mary Anning (1799–1847) spent her lifetime teaching herself about fossils and combing the rugged shore for ancient treasures. Her collection thrilled the public, excited the scientific community, and proved that a woman could overcome danger and social limitations to accomplish great things.

From a very young age, Sue Hendrickson was meant to find things: lost coins, perfume bottles, even hidden treasure. Her endless curiosity eventually led to her career in diving and paleontology, where she would continue to find things big and small. In 1990, at a dig in South Dakota, Sue made her biggest discovery to date: Sue the T. rex, the largest and most complete T. rex skeleton ever unearthed. Named in Sue's honor, Sue the T. rex would be placed on permanent exhibition at the Field Museum of Natural History in Chicago. When Sue Found Sue inspires readers to take a closer look at the world around them and to never lose their brave, adventurous spirits.
