In 1998, the Department of Defense (DoD) began a program of mandatory immunization against anthrax for all military personnel. As the program proceeded, however, some military personnel and their families raised concerns about the safety and efficacy of the anthrax vaccine. Acknowledging both the need to protect military personnel and the concerns about the anthrax vaccine, congress directed the Centers for Disease Control and Prevention (CDC) to carry out a research program on its safety and efficacy. To assist in the development of this program, CDC requested the Institute of Medicine (IOM) to convene a committee to review the completeness and appropriateness of the research program. In An Assessment of the CDC Anthrax Vaccine Safety and Efficacy Research Program, the committee makes an overall assessment of the CDD research plan and reviews the specific studies proposed by CDC in the three areas of efficacy, safety and acceptability. The committee also notes additional research needs that became evident following the bioterrorist events of 2001 and makes recommendations about the leadership of the research program.

The development of medical mycology in the United States is assessed within the context of scientific progress as demonstrated by the creativity and scholarly contributions from research, technological activities, and training toward the management of fungal diseases. Although it focuses on American figures and events, it covers the origins of the discipline in Europe and Latin America. It describes historically significant scientific, technological and educational development and the narrative description is accompanied by an analysis of the causes of these and their perceived impact on the development of the discipline from the late 1880s into the 1990s. The development was conceptualised into five eras: "the era of discovery", "the formative years", "the advent of antifungal and immunosuppressive therapies", "the years of expansion" and "the era of transition".
